

Task 1: AIEA Auditor Group Onboarding
Rami Al Habash 1/13/2026
CMPM 118 Dr. Leilani Glippin

Objective

Completing the onboarding tasks, which include: adding myself to the members database on Notion, adding my profile on the lab website using GitHub, joining the Google Calendar, and making an introductory slide.

Main research/learning point

Using GitHub and Hugo Server to add myself to the AIEA lab website.

Info regarding the main learning point

Adding myself to the GitHub website was fairly streamlined. The main things that I learned more about from this task are Hugo Server and GitHub pull requests.

Hugo server is a cool service that allows you to run the AIEA website locally before fully committing your changes to the web. It was convenient to use Hugo Server.

I wasn't familiar with GitHub pull requests before this task. This task helped me get comfortable with them. I struggled in the beginning because I found myself running into a few errors when it came to committing my files to my forked repo. The main error I had was using the terminal command: "git add ." I should have been manually adding the files to Git instead. I used the command: "git add Rami_Al_Habash.md RamiA.jpg" After figuring out this problem and spending some time debugging the error, everything else went smoothly. I committed the files to my forked repo and submitted a pull request. I am now waiting for approval for my pull request.

Takeaway

I am a lot better at using pull requests and managing forked repos. This will help me a lot while I am here at the lab. I am excited to go into the next task. I did some research on the AIEA projects available this quarter. I also asked group members during the work sessions. After careful consideration, I will move forward with the onboarding process for the LLM logic NeSy lab. I believe it's the right choice because I have some knowledge in that area, and it seems interesting to research.
